SIXTH ASSESSMENT REPORT
Working Group II – Impacts, Adaptation and Vulnerability

Fact sheet - Asia

Climate Change Impacts and Risks

Observed and projected climate change impacts

Rising temperature increases likelihood of the threat of heat waves across Asia, droughts in arid and semi-arid areas of West, Central and South Asia, floods in monsoon regions in South, Southeast and East Asia, and glacier melting in the Hindu Kush Himalaya region (medium confidence).

Ecosystems

Observed biodiversity or habitat loss of animals or plants was linked to climate change in some parts of Asia (high confidence).

Future climate change would cause biodiversity and habitat loss in many parts of Asia using modelling approaches (high confidence). Future climate change will reduce suitable habitat of protected plants.

The risk of irreversible loss of coral reefs, tidal marshes, seagrass meadows, plankton community and other marine and coastal ecosystems increases with global warming, especially at 2°C temperature rise or more (high confidence).

Health

Climate change is increasing vector-borne and water-borne diseases, undernutrition, mental disorders and allergic diseases in Asia by increasing the hazards such as heatwaves, flooding and drought, air pollutants, in combination with more exposure and vulnerability (high confidence).

In addition to all-cause mortality, deaths related to circulatory, respiratory, diabetic and infectious disease, as well as infant mortality are increased with high temperature (high confidence).

Increases in heavy rain and temperature will increase the risk of diarrheal diseases, dengue fever and malaria in tropical and sub-tropical Asia. More frequent hot days and intense heat-waves will increase heat-related deaths in Asia (high confidence).

Water

By mid-21st Century, the international transboundary river basins of Amu Darya, Indus, Ganges could face severe water scarcity challenges due to climatic variability and changes acting as stress multipliers (high confidence).

Due to global warming, Asian countries could experience increase of drought conditions (5-20%) by the end of this century (high confidence).

Cryosphere

Glacier lake outburst flood (GLOF) will threaten the securities of the local and downstream communities in High Mountain Asia (high confidence).

Observed changes in climate resulted in permafrost warming and increased thaw depth in undisturbed locations, but in built up areas these transformations were exacerbated by human activities. By 2050, it is likely that 69% of fundamental human infrastructure in the Pan Arctic will be at risk (medium confidence).

Food

Increased floods and droughts, together with heat stress, will have adverse impact on food availability and prices of food resulting in increased undernourishment in South and Southeast Asia (high confidence).

Energy

Asian countries are experiencing a hotter summer climate, resulting in increase of energy demand for cooling at a rapid rate, together with the population growth (high confidence). Decrease in precipitation influences energy demand as well, as desalination, underground water pumping and other energy-intensive methods are increasingly used for water supply (high confidence).

Among thirteen developing countries with large energy consumption in Asia, eleven are exposed to high energy insecurity and industrial systems risk (high confidence).

Cities and Settlements

Climate change caused losses due to the damage in infrastructure, disruption in services and affected supply chains in Asia (medium confidence) and will increase risk to infrastructure as well as provide opportunities to invest in climate-resilient infrastructure and green jobs (medium confidence).
Adaptation options

Options such as climate smart agriculture, ecosystem-based disaster risk reduction, investing in urban blue-green infrastructure meet adaptation, mitigation, and sustainable development goals simultaneously, presenting opportunities for climate-resilient development (CRD) pathways in Asia (high confidence). Climate risks, vulnerability and adaptation measures need to be factored into decision-making across all levels of governance (high confidence). (ES-Ch10)
